

Surgical Innovations (SI) is delighted to report its recent success at a European paediatric congress (ESPES) in Naples Italy, where it showcased its brand new range of 3mm instruments for use in 'ultra' minimally invasive surgery ('MIS').

SI is focused on achieving the best results for patients and as such, has developed a range of 'ultra' minimally invasive surgical devices which are only 3mm in diameter. The instruments, which will be launched globally next year, include PretzelFlex 3mm, Logi™Range 3mm and YelloPort+plus™ 3mm. All of these devices were displayed at the congress and were all extremely well received.

ESPES is the first paediatric congress SI has attended and was supported throughout the show by Italian partner Surgiline. The aim of the event was to raise the profile of SI's products among paediatric surgeons and gain feedback from clinicians on the new range of 3mm instrumentation.

Paolo Perno, Director of Surgiline who attended the exhibition with SI, said: "Paediatric surgery offers Surgical Innovations and ourselves in Italy, a real opportunity in a brand new market. The prototypes we took to ESPES made a great impression amongst the surgeon attendees and all comments were very positive, especially about PretzelFlex™ 3mm as it's the only one of its kind available in the market."

Graham Bowland, CEO of Surgical Innovations, added: "Following the success of this exhibition, SI will be joining forces with our UK distributor to exhibit at the BAPES meeting in November, further cementing our future position in the UK paediatric market. We have been delighted with all the feedback we have received so far and are excited about working in this new market."
