

Surgical Innovations (SI) is pleased to announce that its latest conference appearance in Edinburgh was a resounding success. The IPEG conference (International Pediatric Endosurgery Group) is an internationally renowned organisation for surgeons who specialise in minimal invasive surgery for children and adolescents. This gave SI the opportunity to make a move into the “Ultra” Minimal Invasive Surgery (MIS) market by showing off its newly patented range of 3mm instruments.

Throughout the four-day event, SI were able to show off their full range of 3mm products, which have been designed to maintain the accurate performance of the 5mm range, without sacrificing the rigidity required for surgery.

“We are continuing to cement strong relationships with the paediatric community around the world. Being at IPEG has certainly confirmed SI’s continued focus on the development of innovative 3mm technology. There are exciting times ahead!” said Katherine Sloggett, Product Marketing Manager.

Throughout the exhibition, the product that received the most interest was SI’s 3mm PretzelFlex™.

Katherine, added: “It is clear that the technology contributing to PretzelFlex’s innovative design is highly beneficial for paediatric surgery. The strength maintained by the device whilst in use, as well as the small area needed to form the signature Pretzel shape, are key elements that continue to draw the attention of international paediatric surgeons.”
