

Surgical Innovations (SI), the designer and manufacturer of creative solutions for Minimally Invasive Surgery ('MIS'), is excited to be hosting two international 'Ultra' MIS congresses at its head office in Leeds this autumn.

The aim of the two 3mm laparoscopic surgery discussion sessions, to be held on Friday 25th October and Friday 8th November 2013, is to unite leading 3mm clinicians from all over the UK and Europe; providing a unique opportunity for international surgeons to debate the future of 3mm laparoscopic surgery

MIS techniques dramatically decrease the size of surgical incisions and scars. The recently emerging 'Ultra' MIS is even less invasive than traditional laparoscopy using smaller incisions and 3mm surgical instruments to access internal anatomy, resulting in reduced scarring, less trauma to the abdominal wall, reduced post-operative pain and faster recovery of the patient.

In order to meet the growing patient demand for improved cosmesis, SI has developed and launched an innovative range of 'Ultra' MIS devices. The wide range of 3mm instrumentation available from SI allows the possibility of performing many traditional laparoscopic procedures using 3mm ports, instruments and retraction. SI's 3mm product range can provide significant clinical and cosmetic benefits for patients with minimal change in operating technique involved.

Katherine Sloggett, Clinical Support Manager, said: "SI is proud to be working together with national and international surgeons to drive the future of 3mm devices. We strongly believe that 'Ultra' MIS will be a key driver in the future of laparoscopy and that we have the high level of design and engineering talent at SI needed to stay at the forefront of the 3mm market."
